

MANAGED IDS/IPS

Managed IDS/IPS By Hellfire Security

About Hellfire Security

Hellfire Security is a cybersecurity consulting firm specializing in assessment, and managed security services. No policy, regulation, or compliance ... just attack and defense to build stronger, more secure companies. Its analysts come from a wide range of backgrounds and specialties, are certified, and made up of industry researchers and conference speakers.

About Our Methodology

A large part of our effectiveness comes from having developed a thorough technical methodology that is reliable, repeatable and that definitely goes well beyond automated tools:

- Characterize Flows
- Profile Hosts
- Determine Disposition
 - Enumerate Threat Indicators
 - Match Possible Scenarios
- Develop Response
- Notify Customer

Do you know what lurks beneath the surface of your network? Do you know which applications are talking to whom out on the Internet? Are you sure you know who and what is moving about? Most companies don't! Most of your users and applications are engaged in quite a lot of activity on the network and within the enterprise that you don't know about. And they were invited in ... what about those you didn't?

Hellfire experts will tune your sensors by disabling signatures for technologies you don't have and signatures that provide little detection value (low signal to noise ratios). We suppress responses for any systems or applications that are poorly designed and likely to trigger false positives. And we do all this to ensure that we see only the most relevant events on your network. And those that we do see are thoroughly analyzed to determine the risk to your enterprise and whether a response is needed based on the priorities you outline. This ensures that you are only notified of confirmed incidents and that those incidents are of high priority ... that taking action on will bring the most value to you.

This allows you to get ahead of attackers before they get in, and before they do any damage. Traditionally, organizations only act against attackers after a compromise or breach. This is because they don't see them until then. Managed Security ensures that you see them ahead of time ... as they are ramping up the attack. Allowing you to get ahead of them (with an action plan that we provide) and stop them before they do any damage.

Hellfire Security can monitor your enterprise with the following types of intrusion sensors:

Intrusion Detection Systems

Hellfire Security can monitor your enterprise with intrusion detection systems like Snort, Suricata, and Bro.

Intrusion Prevention Systems

Hellfire Security can also monitor your enterprise with intrusion prevention systems like Sourcefire's 3D System, and IBM Security's XGS.

Advanced Persistent Threat and Advanced Malware Protection Platforms

And Hellfire Security can monitor your enterprise with APT platforms like FireEye and Fidelis too.

Getting Started

Once we have been introduced, we will have an initial meeting to go through your priorities. This will allow us to more easily move to the next step, proposal, and finally the signing of the contract. After contracts are signed, you are scheduled and the process begins ...
