

ASSESSMENT SERVICES

Penetration Testing By Hellfire Security

About Hellfire Security

Hellfire Security is a cybersecurity consulting firm specializing in assessment, and managed security services. No policy, regulation, or compliance ... just attack and defense to build stronger, more secure companies. Its analysts come from a wide range of backgrounds and specialties, are certified, and made up of industry researchers and conference speakers.

About Our Methodology

A large part of our effectiveness comes from having developed a thorough technical methodology that is reliable, repeatable and that definitely goes well beyond automated tools:

- Information Gathering
 - Passive
 - Active
- Vulnerabilities
 - Identification
 - Exploitation
- Password Guessing
- Maintaining Access
- Enumeration
- Elevating Privileges
- Probing Deeper
- Covering Tracks

Hackers and other criminals continually develop new tools to gain access and disrupt networks, staying even with or ahead of the technological curve. Your IT infrastructure is always at risk, and will most probably continue to be. The best you can do, then, is to minimize your exposure to external threats. Research shows that the more difficult it is to successfully exploit your systems, the more likely an attacker will simply move on to their next target. Vigilance is effective, and can prevent attacks on your network.

We conduct professional Penetration Tests against systems within your perimeter network in order to expose hosts that lack adequate security, and then attempts to gain control of them. A Penetration Test is a simulation of a real-world outside attack against a system in order to identify security weaknesses before they are exploited by hackers. Some like to call it Ethical Hacking, we prefer calling things by their logical name.

Although systems may be encroached during the Penetration Test, we will never attempt to erase, alter or harm any of your company's systems or data. This test is done with absolute safety of your infrastructure in mind. Engagements typically range from a few days to three weeks.

Hellfire Security offers the following types of penetration tests:

External Penetration Testing

Hellfire Security identifies and examines vulnerabilities for external, Internet facing systems.

Internal Penetration Testing

Hellfire Security identifies and examines vulnerabilities for internal, Intranet systems.

Application Penetration Testing

Hellfire Security identifies and examines vulnerabilities in specific applications, and/or the sub-systems that support them.

Getting Started

Once we have been introduced, we will have an initial meeting to go through your scope, and define the rules of engagement. This will allow us to more easily move to the next step, proposal, and finally the signing of the contract. After contracts are signed, allowing us to legally proceed, you are scheduled and the process begins ...
